

AMENDMENTS TO THE CLAIMS

Claims 1-14 (Cancelled)

Claim 15 (Currently Amended) A system comprising:

an optical disc having a disc region code assigned thereto and having content and a content identifier identifying the content recorded thereon; and

a playback apparatus for playing back the optical disc,

wherein the playback apparatus comprises:

a processor that judges whether the disc region code assigned to the optical disc matches an apparatus region code assigned to the playback apparatus and that reads the content identifier of the content recorded on the optical disc;

a memory that stores predetermined additional data corresponding to the optical disc, wherein the predetermined additional data includes a substitute playback order of the content recorded on the optical disc and a substitute content, such that a predetermined part of the content recorded on the optical disc is capable of being replaced by the substitute content, and the memory is distinct from the optical disc; and

a playback unit that plays back the content when the processor judges that the disc region code matches the apparatus region code,

wherein, when the processor judges that the disc region code does not match the apparatus region code, the processor judges whether a combination of the content identifier read by the processor and the apparatus region code satisfies a predetermined condition defined by an owner of rights of the content, and

wherein, when the processor judges that the combination of the content identifier read by the processor and the apparatus region code satisfies the predetermined condition defined by the owner of the rights of the content, (i) the processor replaces the predetermined part of the content recorded on the optical disc with the substitute content of the predetermined additional data that is stored in the memory and that corresponds to the optical disc, in order to create a predetermined package, based on the substitute play back order of the predetermined additional data that is stored in the memory and that corresponds to the optical disc, and (ii) the playback unit plays back the created predetermined package; and

~~wherein, when the processor judges that the combination of the content identifier read by the processor and the apparatus region code does not satisfy the predetermined condition defined by the owner of the rights of the content, the playback unit does not play back the content.~~

Claim 16 (Currently Amended) The system of claim 15, wherein:

the content recorded on the optical disc of the system includes an AV stream, playlist information, and a dynamic scenario;

the AV stream is a stream obtained by multiplexing a video stream, an audio stream, and a subtitle stream;

the playlist information is information including one or more pairs of start time information and end time information in a playback time axis of the AV stream, each pair of start time information and end time information defining a playback section;

the dynamic scenario is a program that causes the playback apparatus to play back the playlist information;

the predetermined additional data is any of the AV stream, the playlist information, and the dynamic scenario supplied to the playback apparatus via a network; and

the playback of the created predetermined package includes (i) a playback of one of an additional audio stream and an additional subtitle stream that are not recorded on the optical disc of the system, and (ii) a playback of a playback section of the AV stream that is different from the playback section defined by the playlist information of the content of the optical disc of the system.

Claim 17 (Currently Amended) The system of claim 16, wherein:

the playlist information of the content recorded on the optical disc of the system includes a playback authorization setting that indicates which playback of the video stream, the audio stream, and the subtitle stream is authorized or not; and

the created predetermined package includes a playback authorization setting that is different from the playback authorization setting defined by the playlist information of the content recorded on the optical disc of the system.

Claim 18 (Currently Amended) The system of claim 17,

wherein the playback apparatus further comprises ~~comprising~~ a transmitting unit that transmits an authorization request to a server apparatus on a network of an external system, the authorization request indicating the combination of the content identifier read by the processor and the apparatus region code,

wherein, when the predetermined condition is satisfied, the server apparatus transmits an

authorization response in reply to the authorization request, and

wherein, when the predetermined condition is not satisfied, the server apparatus transmits a non-authorization response.

Claim 19 (Currently Amended) The system of claim 18, wherein:

the server apparatus includes a playback authorization list including combinations of a content identifier and a region code, each combination indicating that a content identified by a respective content identifier is allowed to be played back in a region identified by a respective region code; and

the predetermined condition is satisfied when the playback authorization list of the server apparatus includes the combination of the content identifier and the apparatus region code indicated by the authorization request transmitted by the transmitting unit of the playback apparatus.

Claim 20 (Currently Amended) The system of claim 18, wherein:

the server apparatus includes a plurality of pieces of date/time information, each piece of date/time information indicating, for a corresponding combination of a content identifier and a region code, a release date/time of a content identified by the content identifier for a region identified by the region code of the corresponding combination;

the authorization request transmitted from the transmitting unit of the playback apparatus to the server apparatus includes a combination of (i) a current time in a region to which the playback apparatus belongs, (ii) the content identifier of the content to be played back, and (iii)

the apparatus region code; and

the predetermined condition is satisfied when the current time included in the authorization request is past the release date/time indicated in a piece of date/time information for a corresponding combination of the content identifier and the region code that is the same as the combination of the content identifier and the region code included in the authorization request.

Claim 21 (Currently Amended) The system of claim 18, wherein:

the server apparatus includes a plurality of pieces of distributor information, each piece of distribution information indicating, for a corresponding combination of a content identifier and a region code, a distributor for a region identified by the region code of the corresponding combination;

the authorization request transmitted from the transmitting unit of the playback apparatus to the server apparatus includes a combination of (i) the content identifier of the content to be played back, (ii) the apparatus region code, and (iii) the disc region code; and

the predetermined condition is satisfied when a distributor indicated in a first piece of distributor information matches a distributor indicated in a second piece of distribution information, the first piece of distributor information indicating a distributor for a corresponding combination of the content identifier and the apparatus region code that is the same as the combination of the content identifier and the apparatus region code included in the authorization request, and the second piece of distributor information indicating a distributor for a corresponding combination of the content identifier and the disc region code that is the same as

the combination of the content identifier and the disc region code included in the authorization request.

Claim 22 (New) The system of claim 15, wherein:

the playback unit plays back the content when the processor judges that the disc region code matches the apparatus region code; and

when the processor judges that the combination of the content identifier read by the processor and the apparatus region code does not satisfy the predetermined condition defined by the owner of the rights of the content, the playback unit does not play back the content.
